Project Overview & Business Problem

Business Context

"Devv Global" is a mid-sized technology services company with approximately 500 employees across multiple departments.

IT Support Responsibilities

1. Hardware/software issues
2. Access and account requests
3. Network/connectivity problems
4. Application support
5. General IT service requests

Problem statement:

Devv Global's decentralized IT support process causes requests to be missed, inconsistently prioritized, difficult to track, and dependent on manual follow-ups. The IT team also lacks centralized visibility into request volume, status, ownership, and SLA performance.

Business impact

- Missed/delayed requests
- Longer resolution times
- Poor employee experience
- Inefficient IT workload management
- Limited management visibility
- No reliable SLA tracking

Project Objectives

The project aims to:

- **Centralize** employee IT service requests through a single request-management process.
- **Improve prioritization and assignment** of requests based on category and urgency.
- Provide request visibility so employees can track status without repeated follow-ups.
- **Improve SLA monitoring** by giving the IT team visibility into request ownership and resolution timelines.
- **Improve management visibility** through basic reporting on request volume, status, priority, and resolution performance.

✓ Success Criteria

We'll measure the proposed solution against these targets:

	Target
1	100% of IT requests are recorded in the centralized system
2	Employees can view the status of their requests
3	Every request has an assigned category, priority, and owner
4	IT management can monitor open requests and SLA status
5	Request history is available for tracking and reporting

Requirements Traceability Matrix

MoSCoW Prioritization

Story	Priority
US1 — Submit Request	Must Have
US2 — Categorize Request	Must Have
US3 — Prioritize Request	Must Have
US4 — Assign Request	Must Have
US5 — Track Request	Must Have
US6 — Update Request	Must Have
US7 — Monitor SLA	Should Have
US8 — View Reports	Should Have

MVP = US1–US6

Requirement → Story Traceability

Business Requirement	User Story
BR1	US1
BR2	US1, US2
BR3	US3
BR4	US4
BR5	US5
BR6	US7
BR7	US8

Stakeholders & Scope

Stakeholders:

Stakeholder	Role	Main Need
Employees	IT service requesters	Easy submission + status tracking
IT Support Agents	Resolve requests	Clear queue, priority, ownership
IT Support Manager	Manage IT operations	SLA + workload visibility
Department Managers	Business stakeholders	Minimize employee downtime
HR/Admin	Supporting stakeholder	Employee/access-related coordination
Project/Product Owner	Business decision-maker	Business value + successful delivery

Scope:

In Scope-

- Employee IT service-request submission
- Request categorization
- Priority assignment
- IT assignment/ownership
- Request status tracking
- Request updates and resolution
- SLA tracking
- Basic request reporting
- Notifications/status communication

Out of Scope

- Actual IT infrastructure implementation

- Hardware procurement
- Payroll/HR requests
- Financial processes
- Advanced AI chatbot
- Full IT asset-management system
- Detailed production deployment

Assumptions:

- Employees have company credentials.
- IT Support staff will use the centralized system.
- Requests can be categorized using predefined categories.
- SLA rules can be defined by priority.
- Email/system notifications are available.

TO-BE Process & Proposed Solution

TO-BE Process Flow

Key Improvements

AS-IS	TO-BE
Multiple channels	Centralized request portal
Manual recording	Structured request creation
Inconsistent priority	Defined priority rules
Unclear ownership	Assigned IT agent
Manual follow-ups	Self-service status tracking
Limited SLA visibility	SLA monitoring
Fragmented information	Centralized reporting

AS-IS vs TO-BE Improvement Analysis

Area	AS-IS	TO-BE	Improvement
Request intake	Multiple channels	Centralized portal	Reduced missed requests

Request information	Manual/inconsistent	Structured fields	Better data quality
Priority	Manual	Impact + urgency	Consistent prioritization
Ownership	Unclear	Assigned agent	Clear accountability
Status	Manual follow-ups	Self-service tracking	Better visibility
SLA	Limited visibility	SLA monitoring	Better control
Reporting	Fragmented	Centralized data	Better decision-making

Business outcome

The TO-BE process establishes a standardised, centralised and trackable IT service-request lifecycle that addresses the main gaps found in the AS-IS analysis.

AS-IS Analysis & Gap Analysis

AS-IS Process Flow

⚠ Identified Gaps and Impacts

ID	Gap	Root Cause	Business Impact
G1	Multiple request channels	No centralized intake mechanism	Requests may be missed
G2	Manual request recording	No standardized ticketing process	Incomplete/inconsistent information
G3	Manual prioritization	No defined priority rules	Inconsistent handling of urgent issues
G4	Unclear ownership	No centralized assignment mechanism	Delayed resolution
G5	Manual status follow-ups	Employees lack self-service	Time wasted on follow-ups

		tracking	
G6	Limited SLA visibility	No centralized SLA tracking	Management cannot monitor performance effectively
G7	Limited reporting	Request data is fragmented	Poor workload and trend visibility

Business & Functional Requirements

Business Requirements:

ID	Business Requirement
BR1	The system shall provide a centralized channel for employees to submit IT service requests.
BR2	The system shall capture standardized request information, including category, description, urgency, and requester details.
BR3	The system shall support request prioritization based on defined business rules.
BR4	The system shall allow IT Support to assign ownership of requests.
BR5	The system shall allow employees to view the status of their requests.
BR6	The system shall support SLA tracking for IT service requests.
BR7	The system shall provide basic reporting on request volume, status, priority, ownership, and resolution performance.

Functional Requirements:

ID	Functional Requirement
FR1	Employees can submit an IT service request through the centralized system.

FR2	The system captures requester, category, description, urgency, and submission date/time.
FR3	IT Support can view, categorize, prioritize, and assign requests.
FR4	The system maintains request statuses: New → Assigned → In Progress → Resolved → Closed.
FR5	Employees can view the current status and details of their submitted requests.
FR6	The system records request timestamps needed for SLA monitoring.
FR7	The system provides basic reports for request volume, status, priority, ownership, and resolution time.
FR8	The system sends notifications when key request events occur, such as assignment, status change, or resolution.

User Stories & Acceptance Criteria

User Stories with Acceptance Criteria

User Story ID	User Story	Acceptance Criteria
US1	As an employee, I want to submit an IT service request so that I can get IT support.	1. Requester details are captured automatically. 2. Category and description are mandatory. 3. Successful submission generates a unique request ID.
US2	As an IT Support Agent, I want to categorize requests so that they can be handled appropriately.	1. Agent can select a predefined category. 2. Category is saved with the request. 3. Request cannot proceed without a category.
US3	As an IT Support Agent, I want to prioritize requests based on impact and urgency so that critical issues are handled first.	1. Impact and urgency can be recorded. 2. System determines/records the resulting priority. 3. Priority is visible to IT Support.
US4	As an IT Support Manager, I want to assign requests to IT Support Agents so that	1. Manager can select an available agent. 2. Assigned agent is recorded.

	every request has clear ownership.	3. Assignment is visible in the request.
US5	As an employee, I want to view my request status so that I know its progress without contacting IT.	1. Employee can view submitted requests. 2. Current status is displayed. 3. Request ID and key details are visible.
US6	As an IT Support Agent, I want to update request status so that the request lifecycle is accurately tracked.	1. Agent can update status. 2. Allowed statuses follow the defined workflow. 3. Status changes are recorded.
US7	As an IT Support Manager, I want to monitor SLA performance so that delayed requests can be identified and addressed.	1. SLA target is associated with priority. 2. Current SLA status is visible. 3. Overdue requests can be identified.
US8	As an IT Support Manager, I want to view basic service-request reports so that I can monitor workload and performance.	1. Reports show request volume. 2. Reports can show status, priority, ownership, and resolution time. 3. Data can be filtered for meaningful analysis.

Non-Functional Requirements & Business Rules

Non-Functional Requirements

ID	Category	Requirement
NFR1	Usability	Employees should be able to submit a request with minimal steps.
NFR2	Performance	Request submission and status updates should respond within 3 seconds under normal load.
NFR3	Availability	System should be available during normal business operations.
NFR4	Security	Only authenticated employees and authorized IT staff can access relevant request information.
NFR5	Auditability	Request status, assignment, and key updates should be recorded.
NFR6	Scalability	The solution should support growth in employees and request volume without major redesign.

Business Rules

ID	Business Rule
BRULE1	Every request must have a category and description.
BRULE2	Every request must have a priority.
BRULE3	Every request must have an owner once assigned.
BRULE4	Priority is determined using impact + urgency.
BRULE5	Only authorized IT Support staff can change assignment or priority.
BRULE6	A request can be closed only after it has been resolved.
BRULE7	SLA targets depend on request priority.
